

Here, `FilterTableEventListener` has two arguments. The first one is the page where to extract table, the second one is a Boolean value that indicates whether table has borders or not.

## Points of Interest

A table with the same data and cell can store differently in PDFs. By studying various PDF files, it is observed that a line can render in PDF by `LineTo(1)` command and also by `Rectangle(re)` command. That means that a line is saved in PDF as rectangle with very tiny width (vertical line) or very tiny height (horizontal line).

Same data of PDF can store many different ways in PDF. Same Text, same shape / structure or path can store different ways. That's why table extraction from PDF mainly depends on location / position extraction and parsing data and object based on location/position.

Some new features added to *iText.kernel.dll*. Following list of files are modified:

## Sales Statistics (Jeep).

JEEP	All Models 2015	All Models 2016	All Models 2017	All Models 2018	All Models 2019
